

Applications:

- Our TVs and computer displays can get by with just the three red/green/blue (or R/G/B) color elements. It makes our computer vision algorithms easier, too.
- Almost every well-known application is compatible with RGB, such as Microsoft Office, Adobe Creative Suite (InDesign, Photoshop, etc.), and other digital editors

Drawbacks of RGB Color:

- One of the major limitations of the RGB color system is that it doesn't translate well to print, which uses the CMYK system.
- This has led to a great deal of frustration when people print out documents from Microsoft Office, only to have them turn out to be the wrong color.
